TECHNOLOGY-MEDIATED LIFEWORLD

CONTEXT

TECHNOLOGY- MEDIATED LIFEWORLD

A New World is emerging as a Smart World,
converging the Cyber, Social, and Physical
Domains

Business and destinations need the wholly new
development principles, policies, processes, and
objectives: sustainable world strategies, comprehensive
planning, integrated models, and globally effective
solutions.

CONTEXT:

TECHNOLOGY-
MEDIATED
LIFEWORLD

SMART
CITIES

"Innovations are not just the results of scientific work in a laboratory-like environment...this is the exception rather than the rule...the causality between science and innovation has proven weaker than expected...innovation emerge increasingly in practice-based processes based on the ability to interact and build networks with other innovation agents" (V. Haarmaakopi et al 2008)

HOW ARE WE DOING
OUR JOB?

A new
and exciting
approach
to tourism
research.

MEASUREMENT Tourist flows

Tourist movement research is a complex **process** of **understanding physical movement** (Xia et al., 2011).

Its link to the decisions tourists make about where, how, and what pace and time to move from one attraction to the next

MEASUREMENT:
why

The question of mobility is of immense importance in tourism research. A key output of the system of tourism statistics is statistical information on tourism flows, i.e. number of trips and nights spent away by visitors outside their usual environment.

You cannot manage what you cannot measure

MEASUREMENT

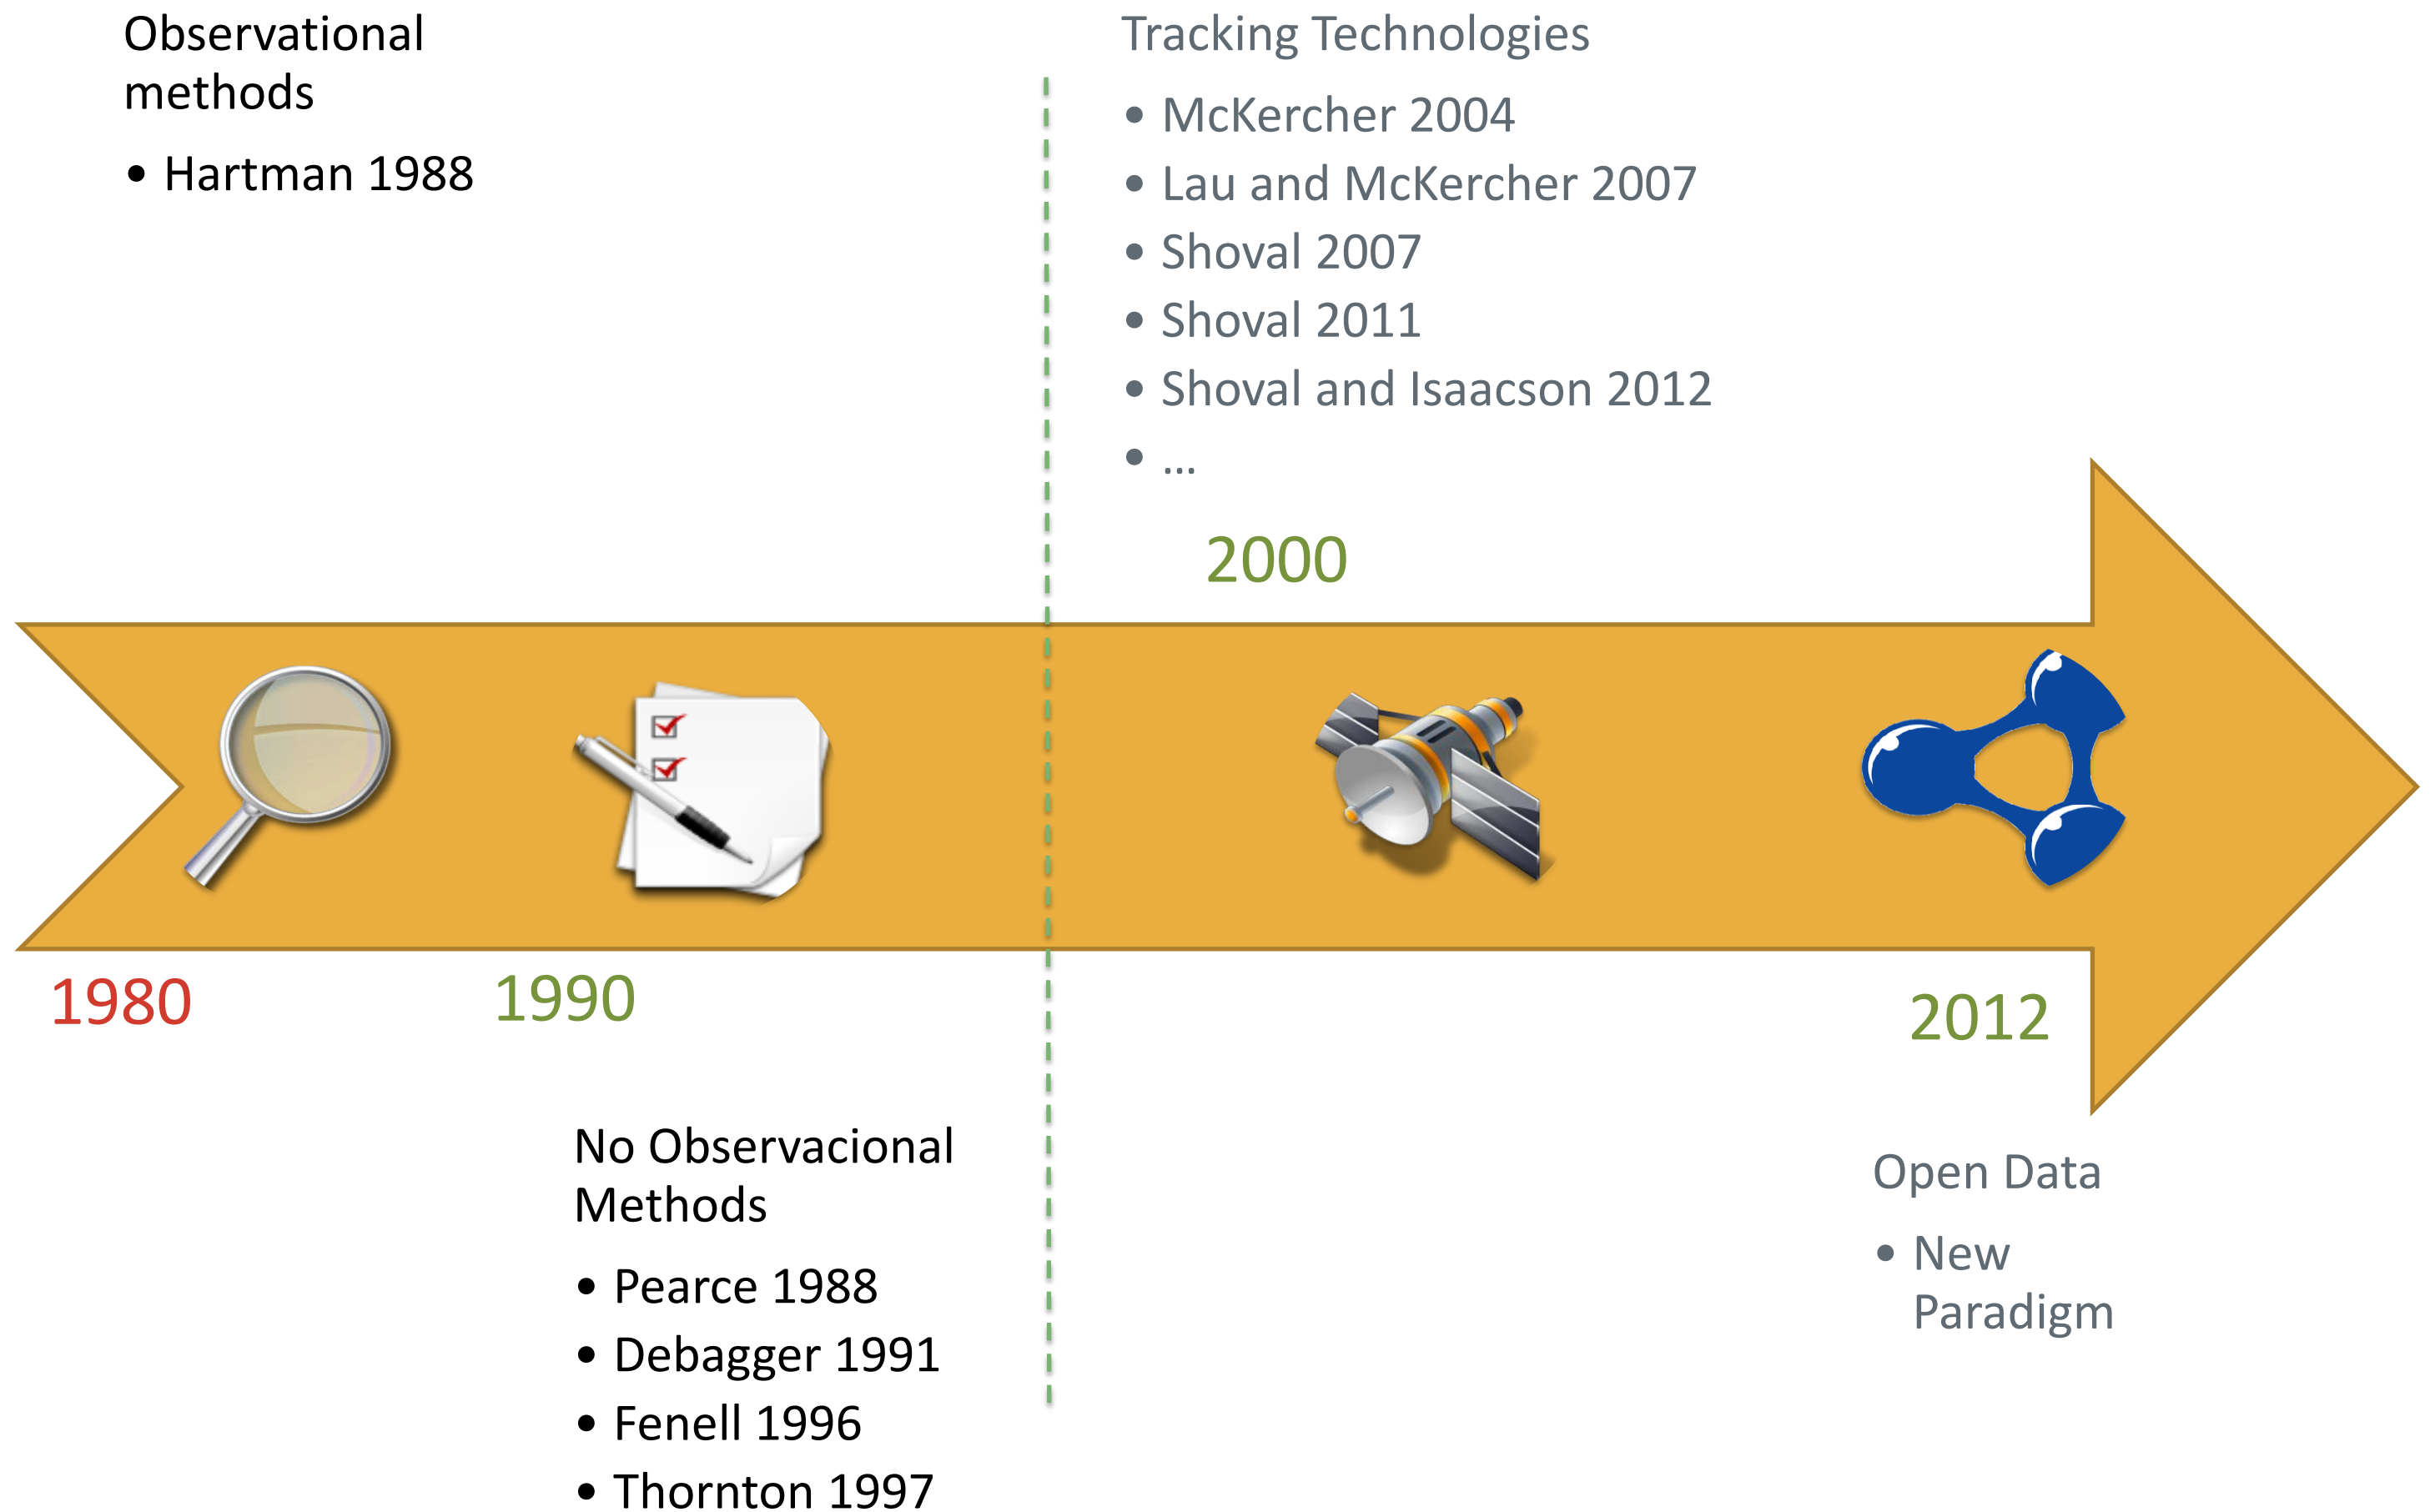

- Measurement tools are strongly linked to technological development
- The depth of the measurement depends on the available technology
- Macro Level (1980-2000)
 - Examines a **discrete** sequence of movement among tourist locations, locations which can be some distance apart
- Micro Level (2000-until now)
 - Movement is seen as a **continuous** process
 - The sequence of movements can be represented accurately as a collection of spatial points

MEASUREMENT

Yet the current methods used to collect data on spatial and temporal activities are limited in accuracy and validity. Recent developments in the field of digital tracking technologies have produced a range of widely available systems, including land-based tracking, satellite navigation, and hybrid systems.

- Thornton 1997

Traditional Techniques

- Research focused primarily on the flow of visitors between destinations
- Macro level
- Few subnational information
- Space-time diaries
 - Systematic recording of space and time
 - Requires the individual active participation in the data capture process.
 - **Subjective process**

TOURIST MOBILITY: Literature Review

New Technologies

- *The technology advances in the field of digital systems, such as GPS tracking devices, have opened a new research field within the tourism discipline.*
- Micro level
- GPS devices, combined with space-time analysis techniques facilitates a **better understanding** of the **visitors' behaviour** diversity.
- **Open Data** will help to identify the context of each point.

Open Data

- New Paradigm

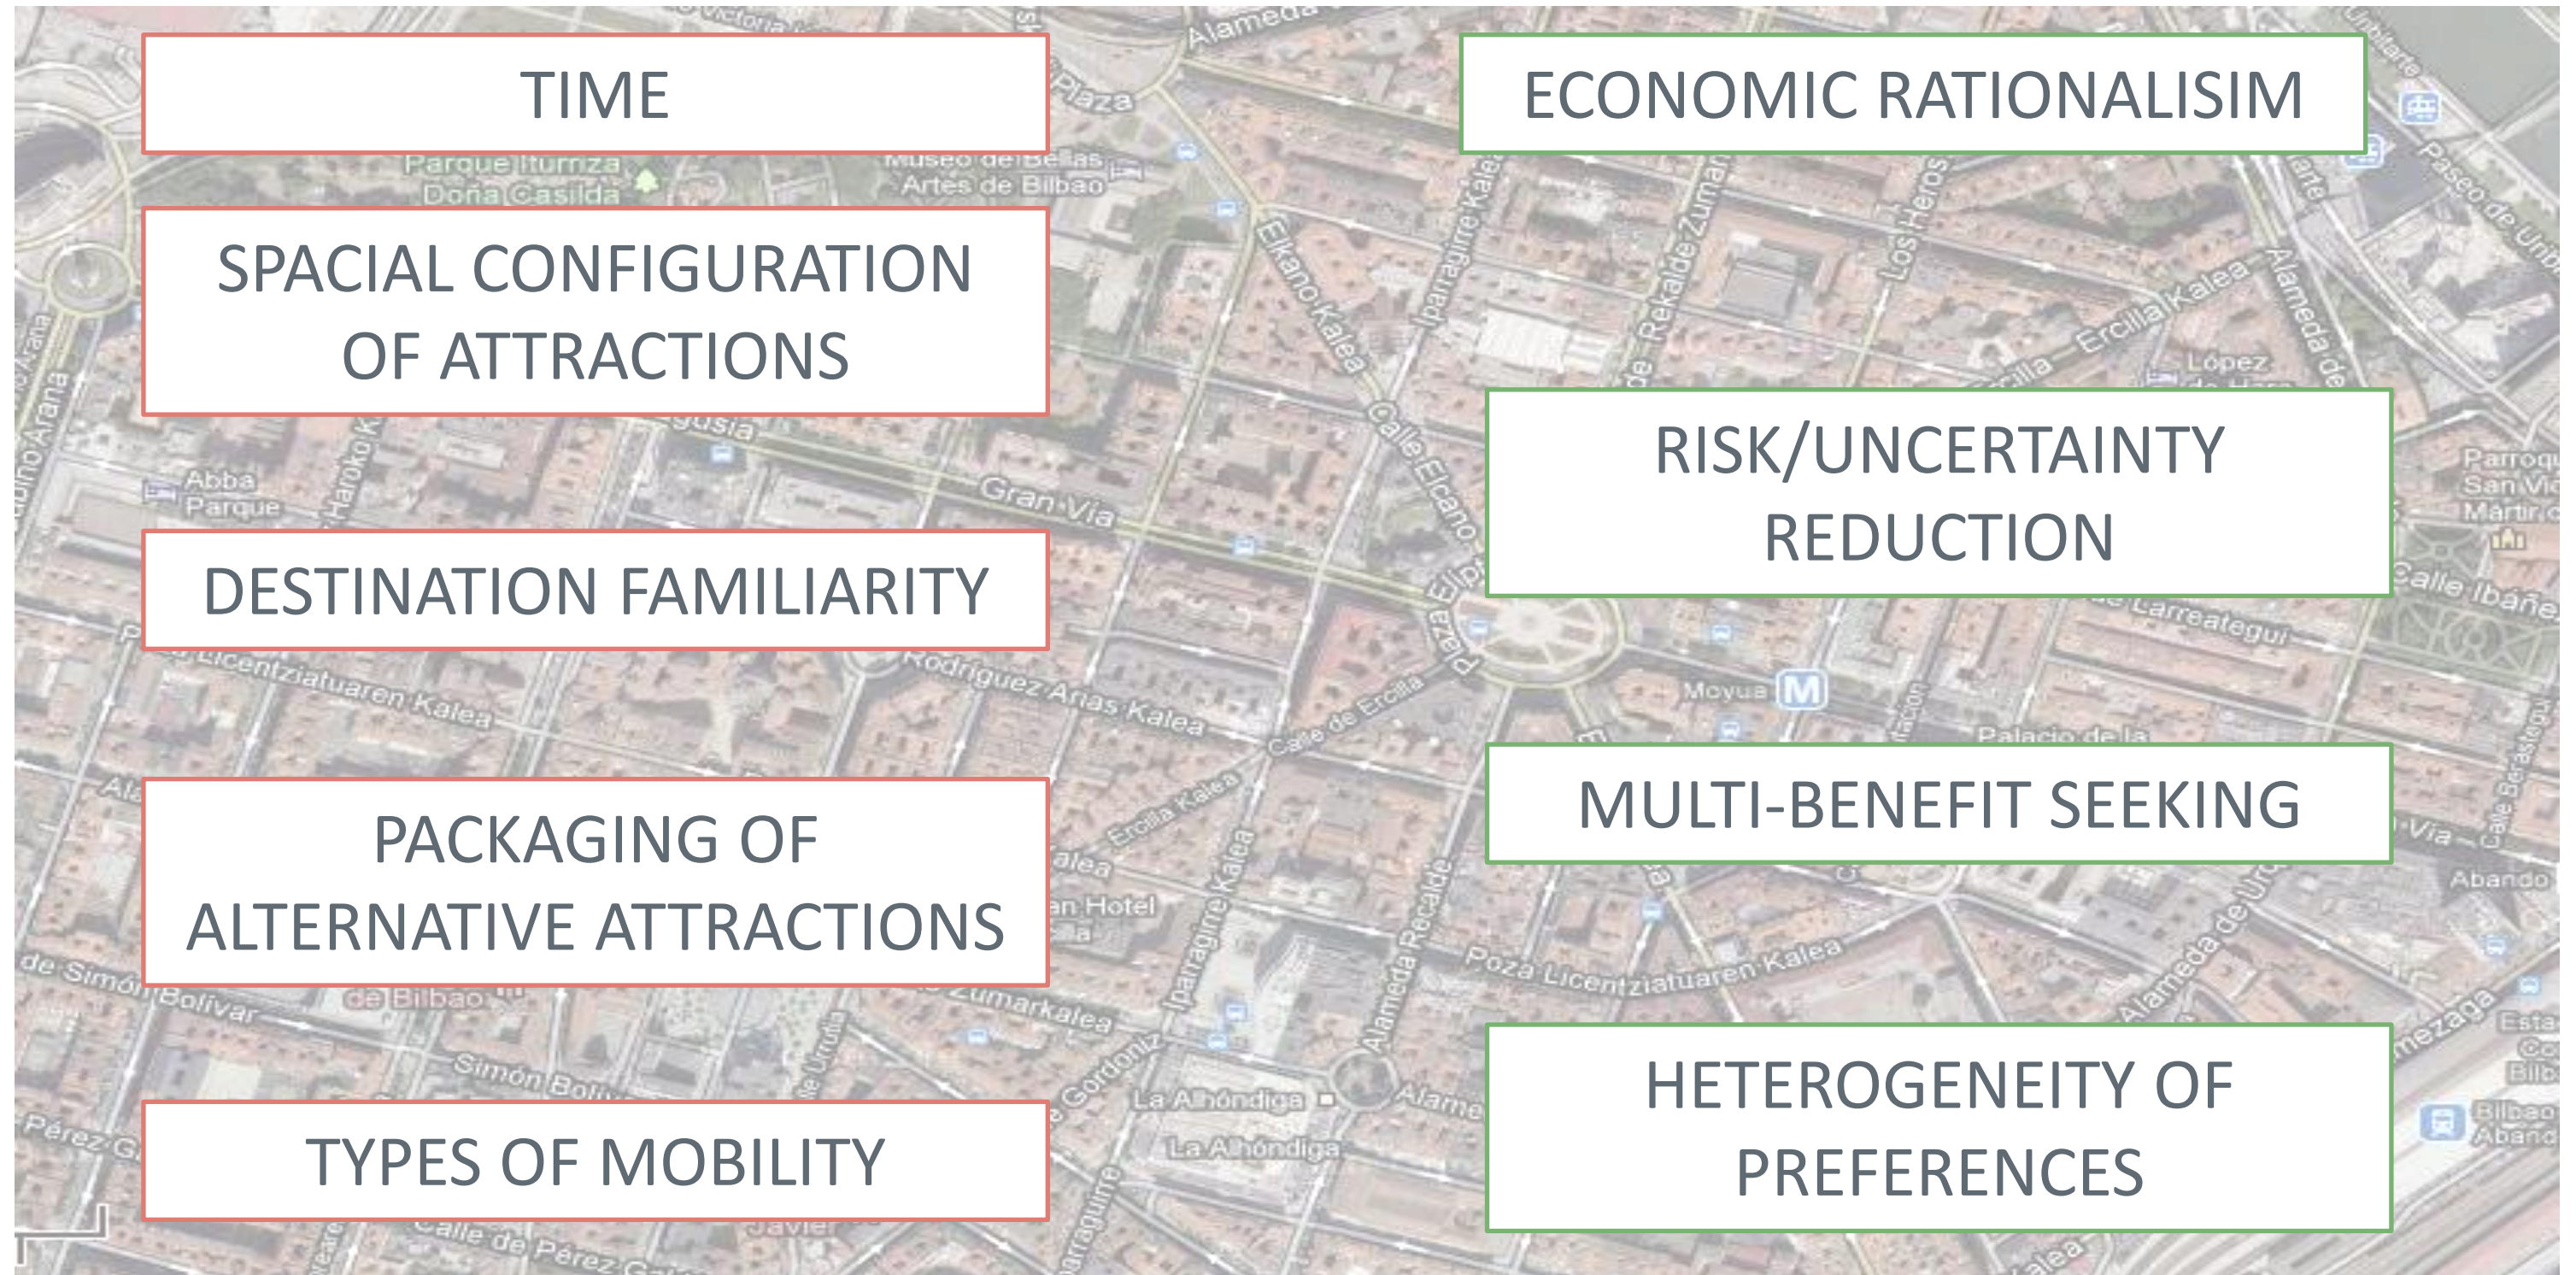

MEASUREMENT Tourist flows

The other major research stream concentrates on MODELLING tourist **wayfinding decision-making process**

- Wayfinding can be described as the process of using spatial and environmental information to find our way in the built environment

MODELLING TOURIST FLOWS: Factors

eGISTour

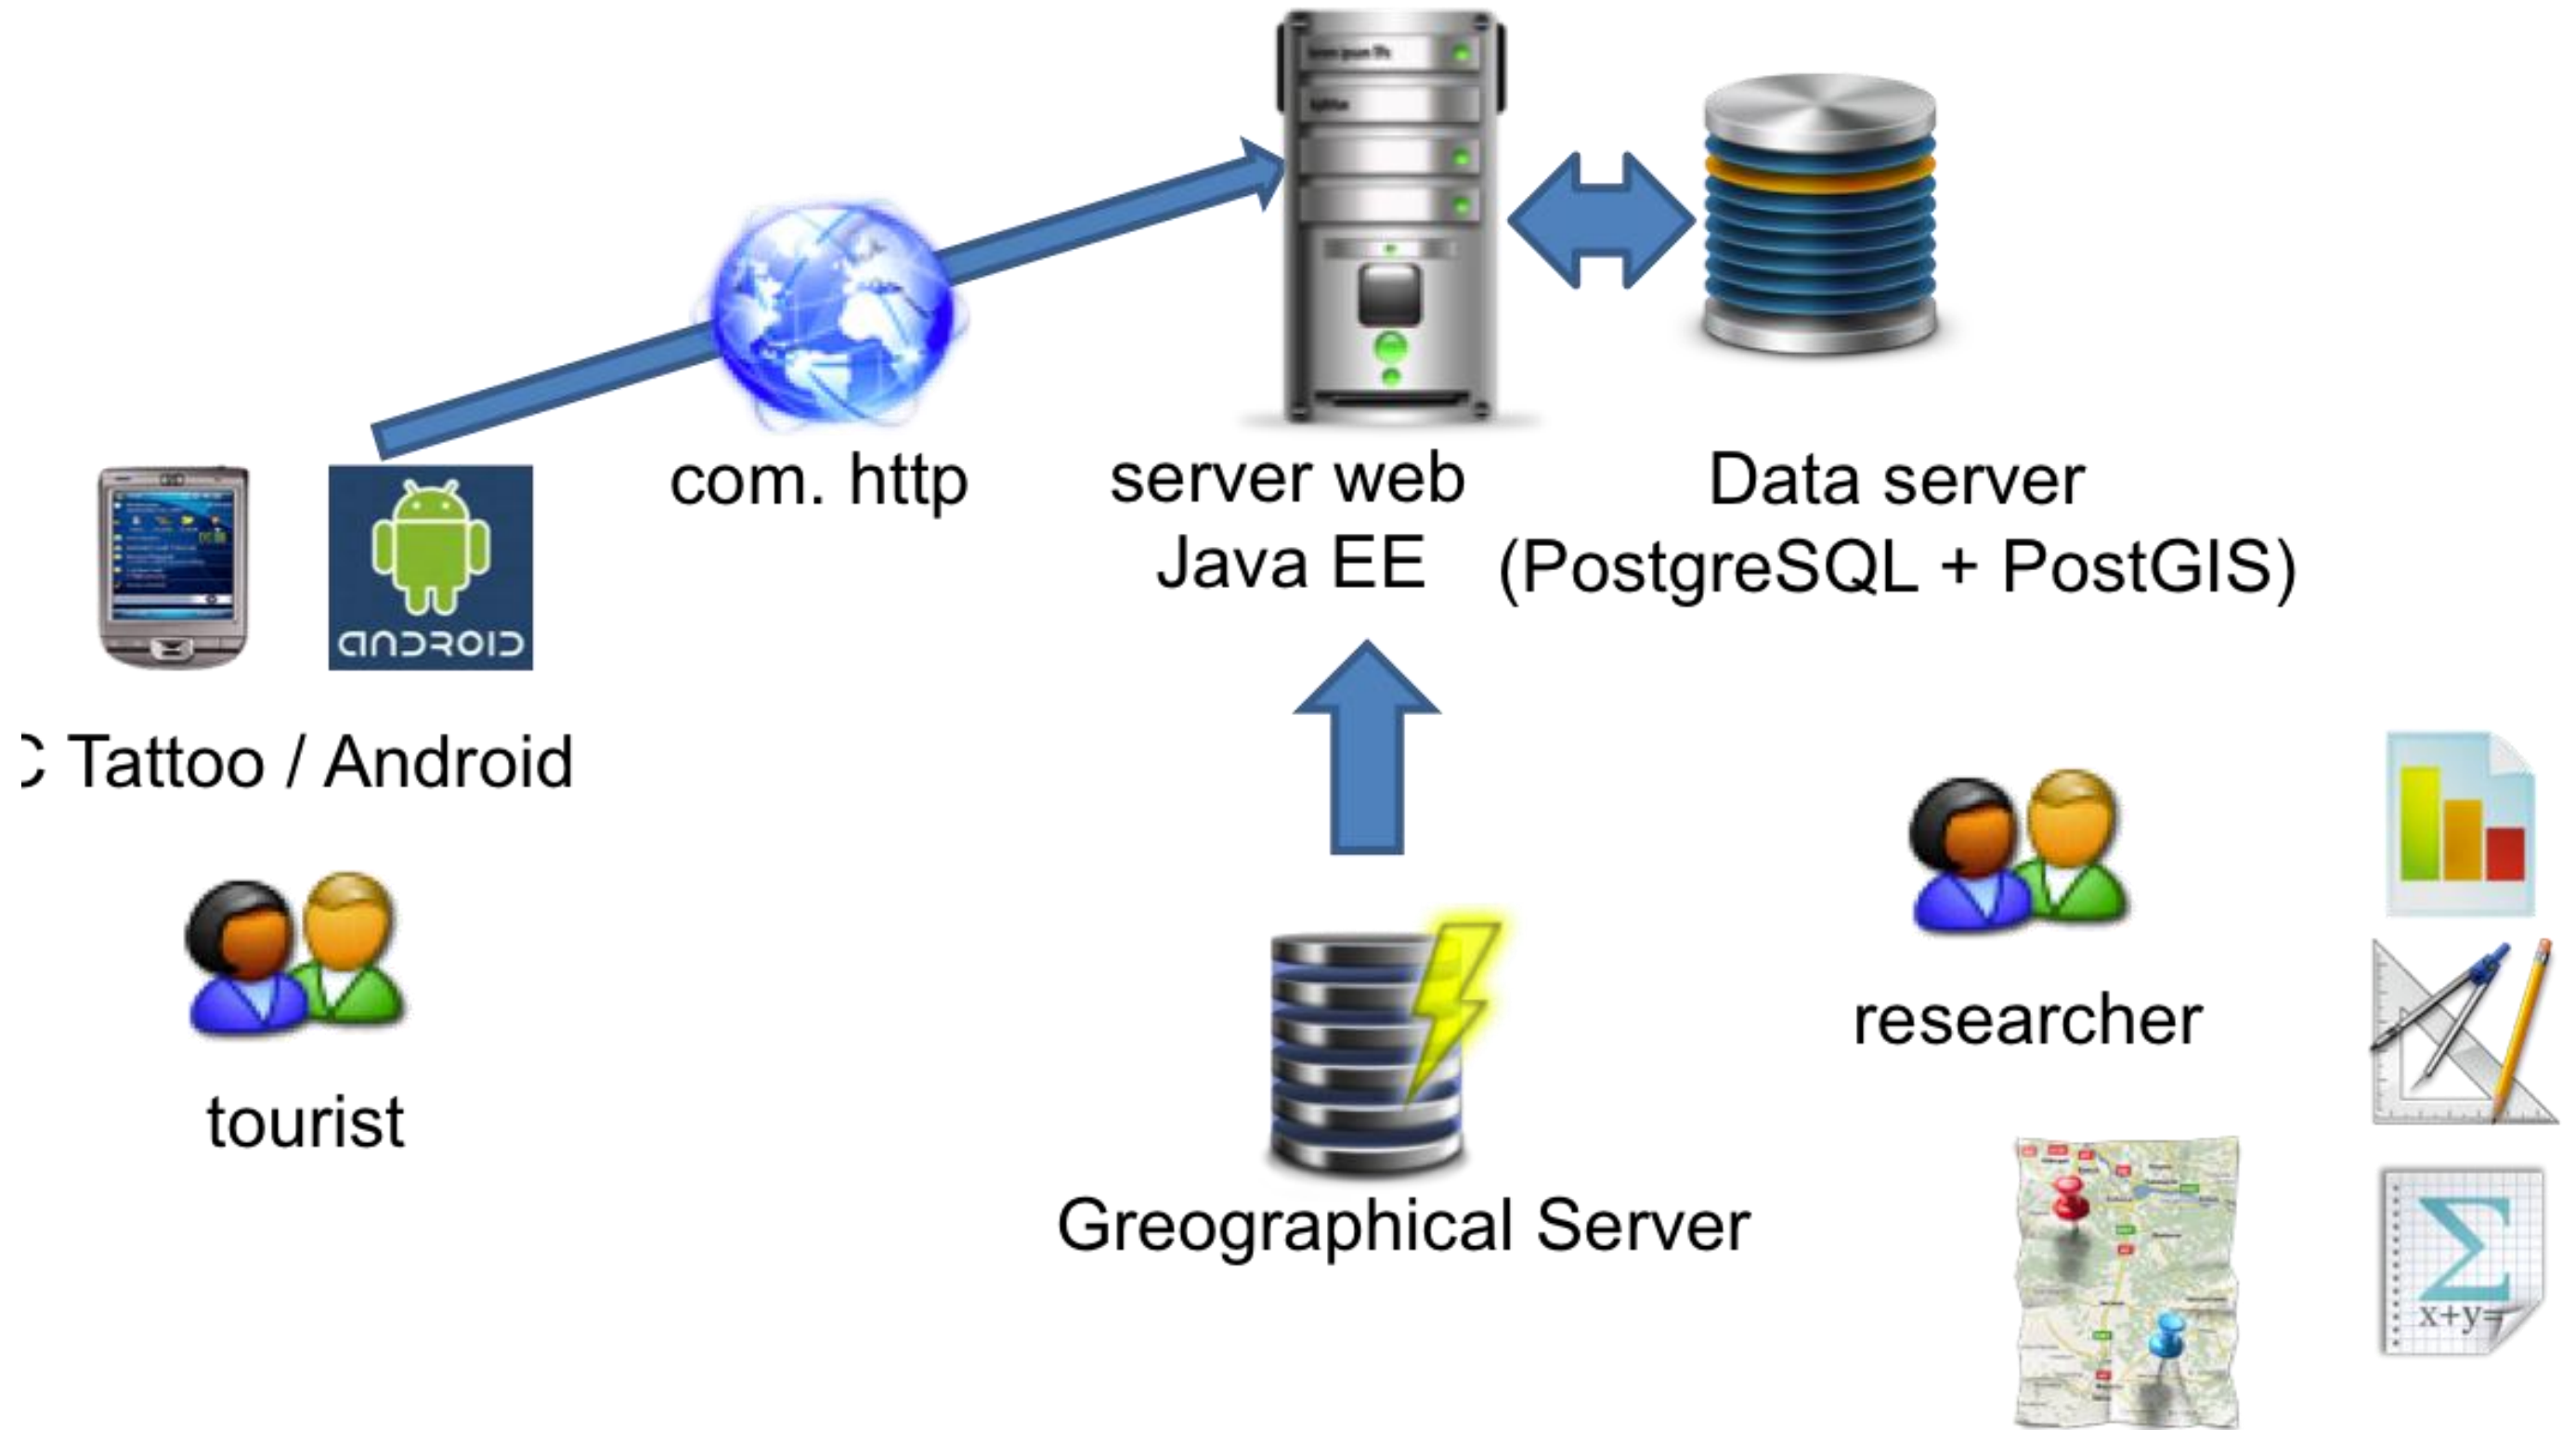

MEASUREMENT: eGIStour

It is a system for measurement, analysis and monitoring of visitor flows.

This SUPPORT us

- Understanding the space-time activity of the visitors in the destination
- Identifying the scale of “destination” based on the real mobility
- Recognizing the most and less frequented places
- Recognizing back spot
- Analyzing the differences on the behavior depending on the type of visitor (typologies, segmentation)

eGIStour: architecture

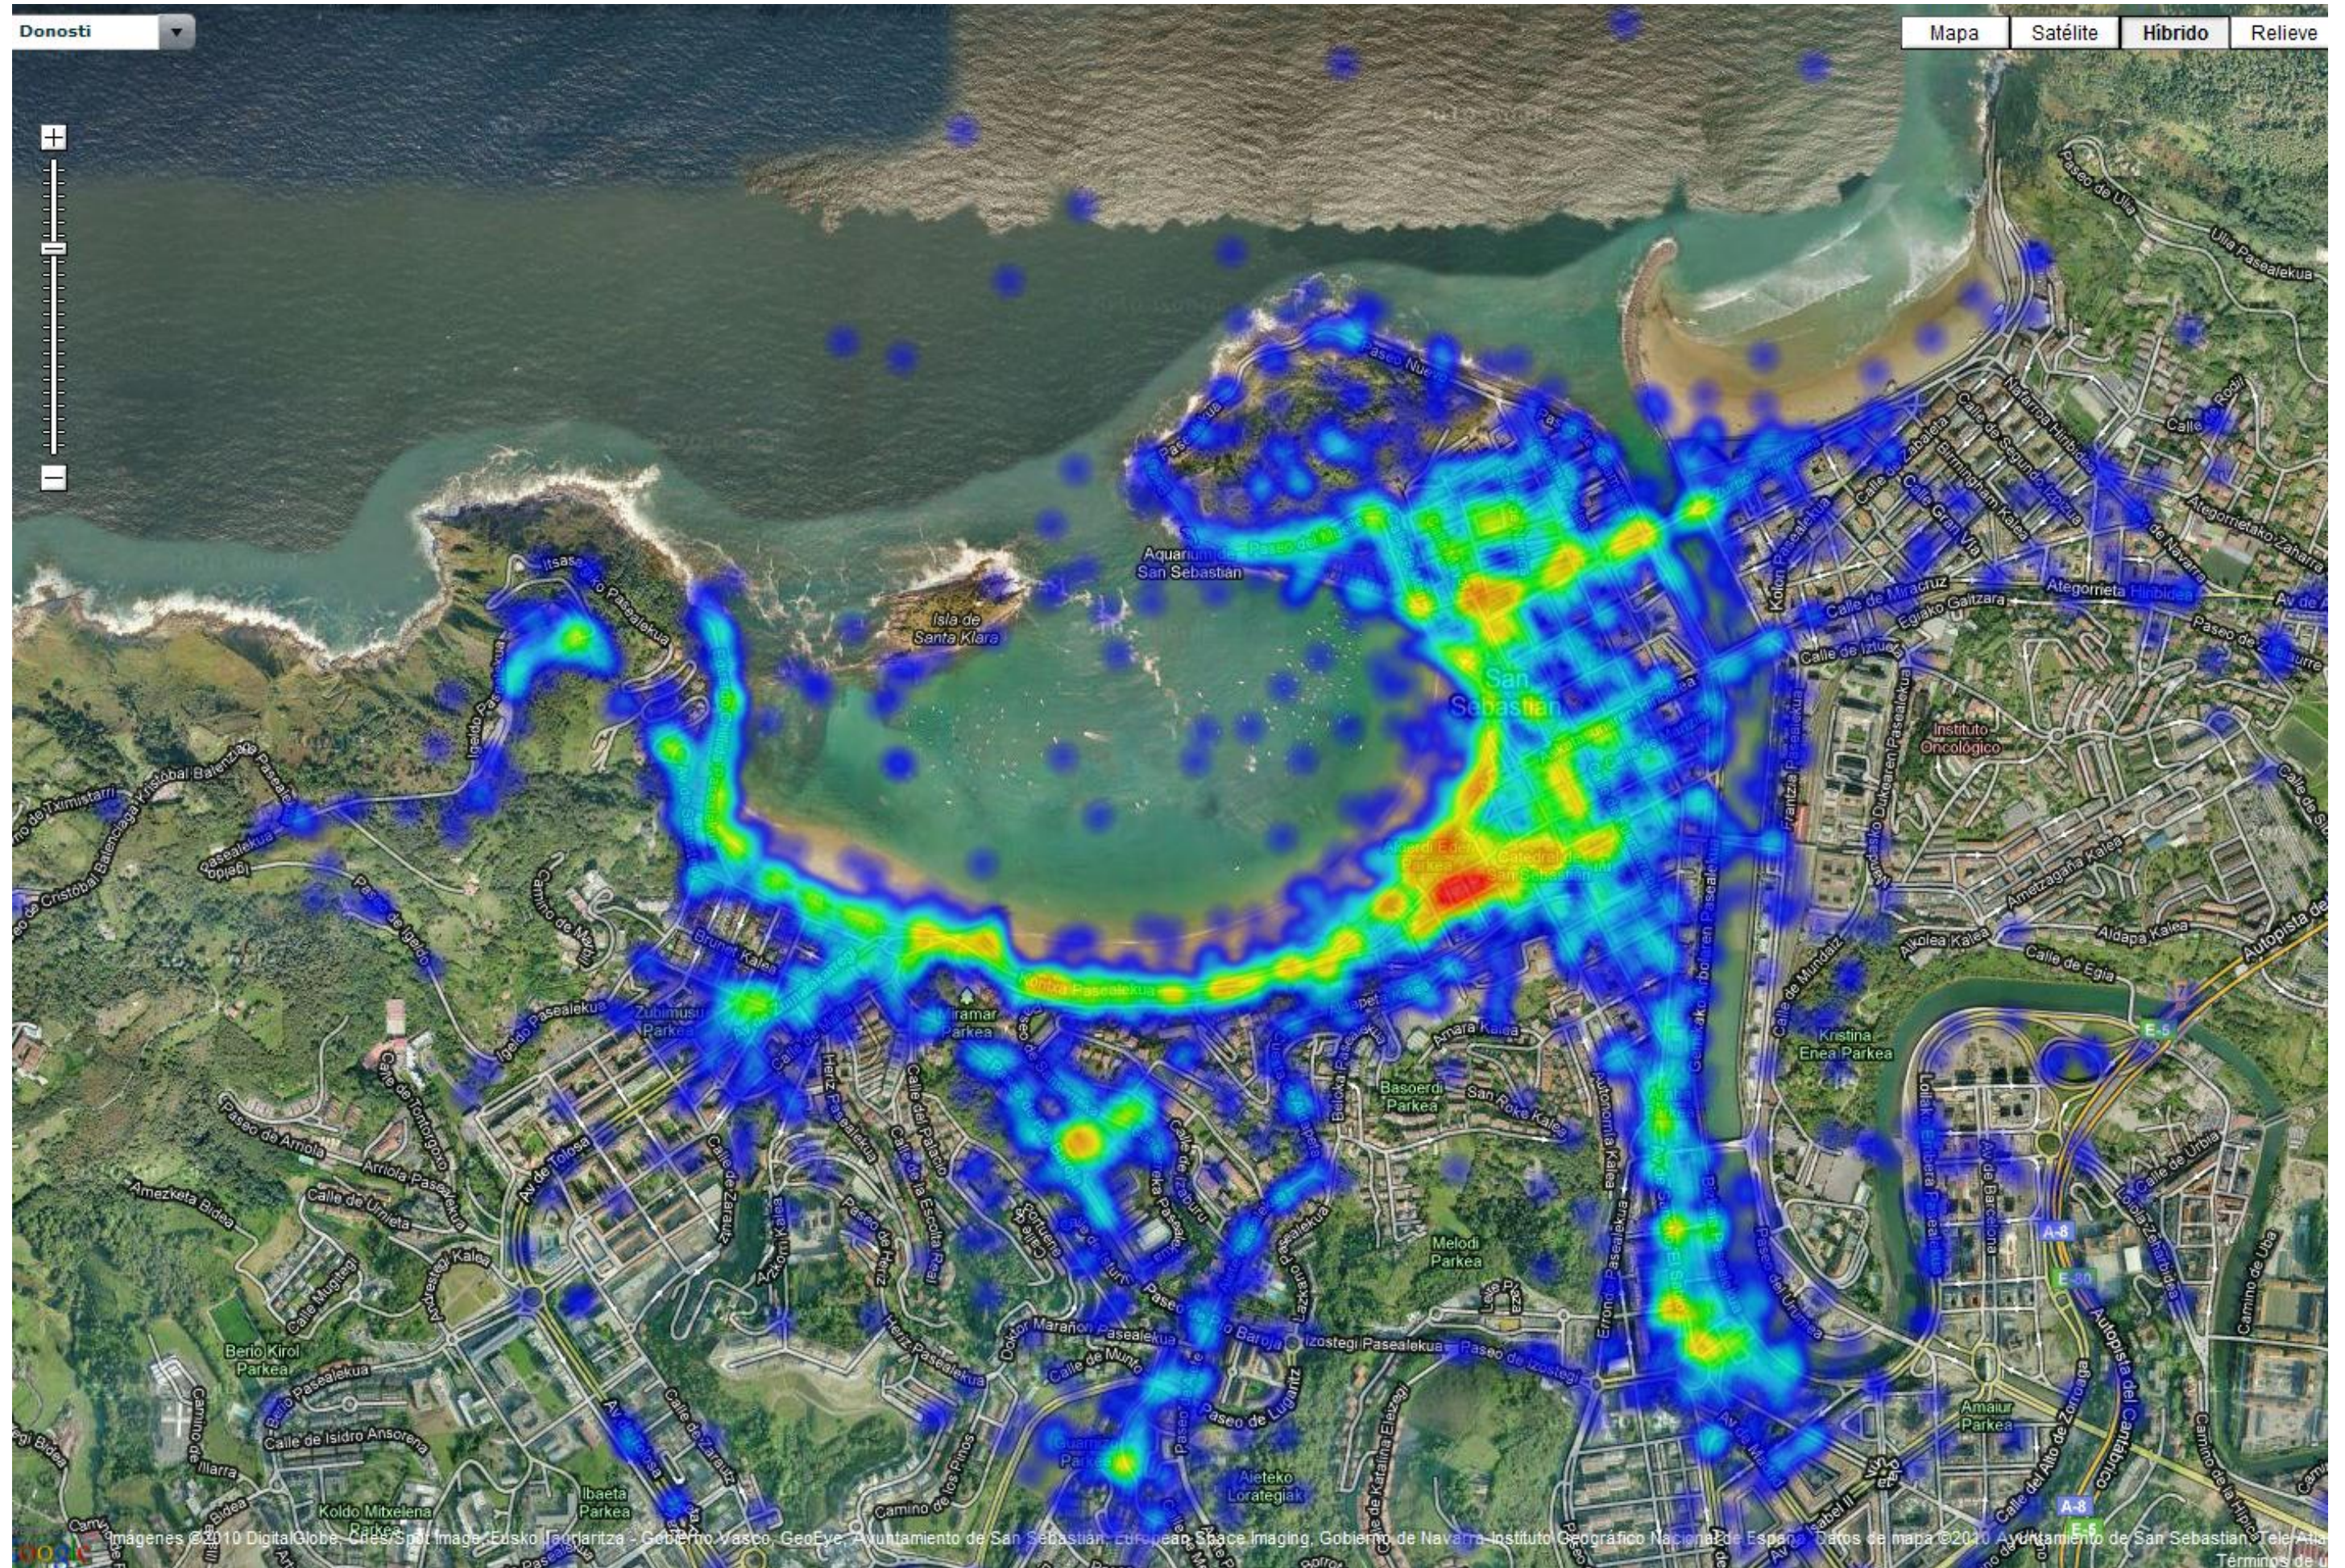

Prepare data

- Assign each variable data type (numeric, categorical, date, etc.) most suitable for analysis.
- Detection of outliers, outside the range of expected values. For example, excessive speeds, etc..

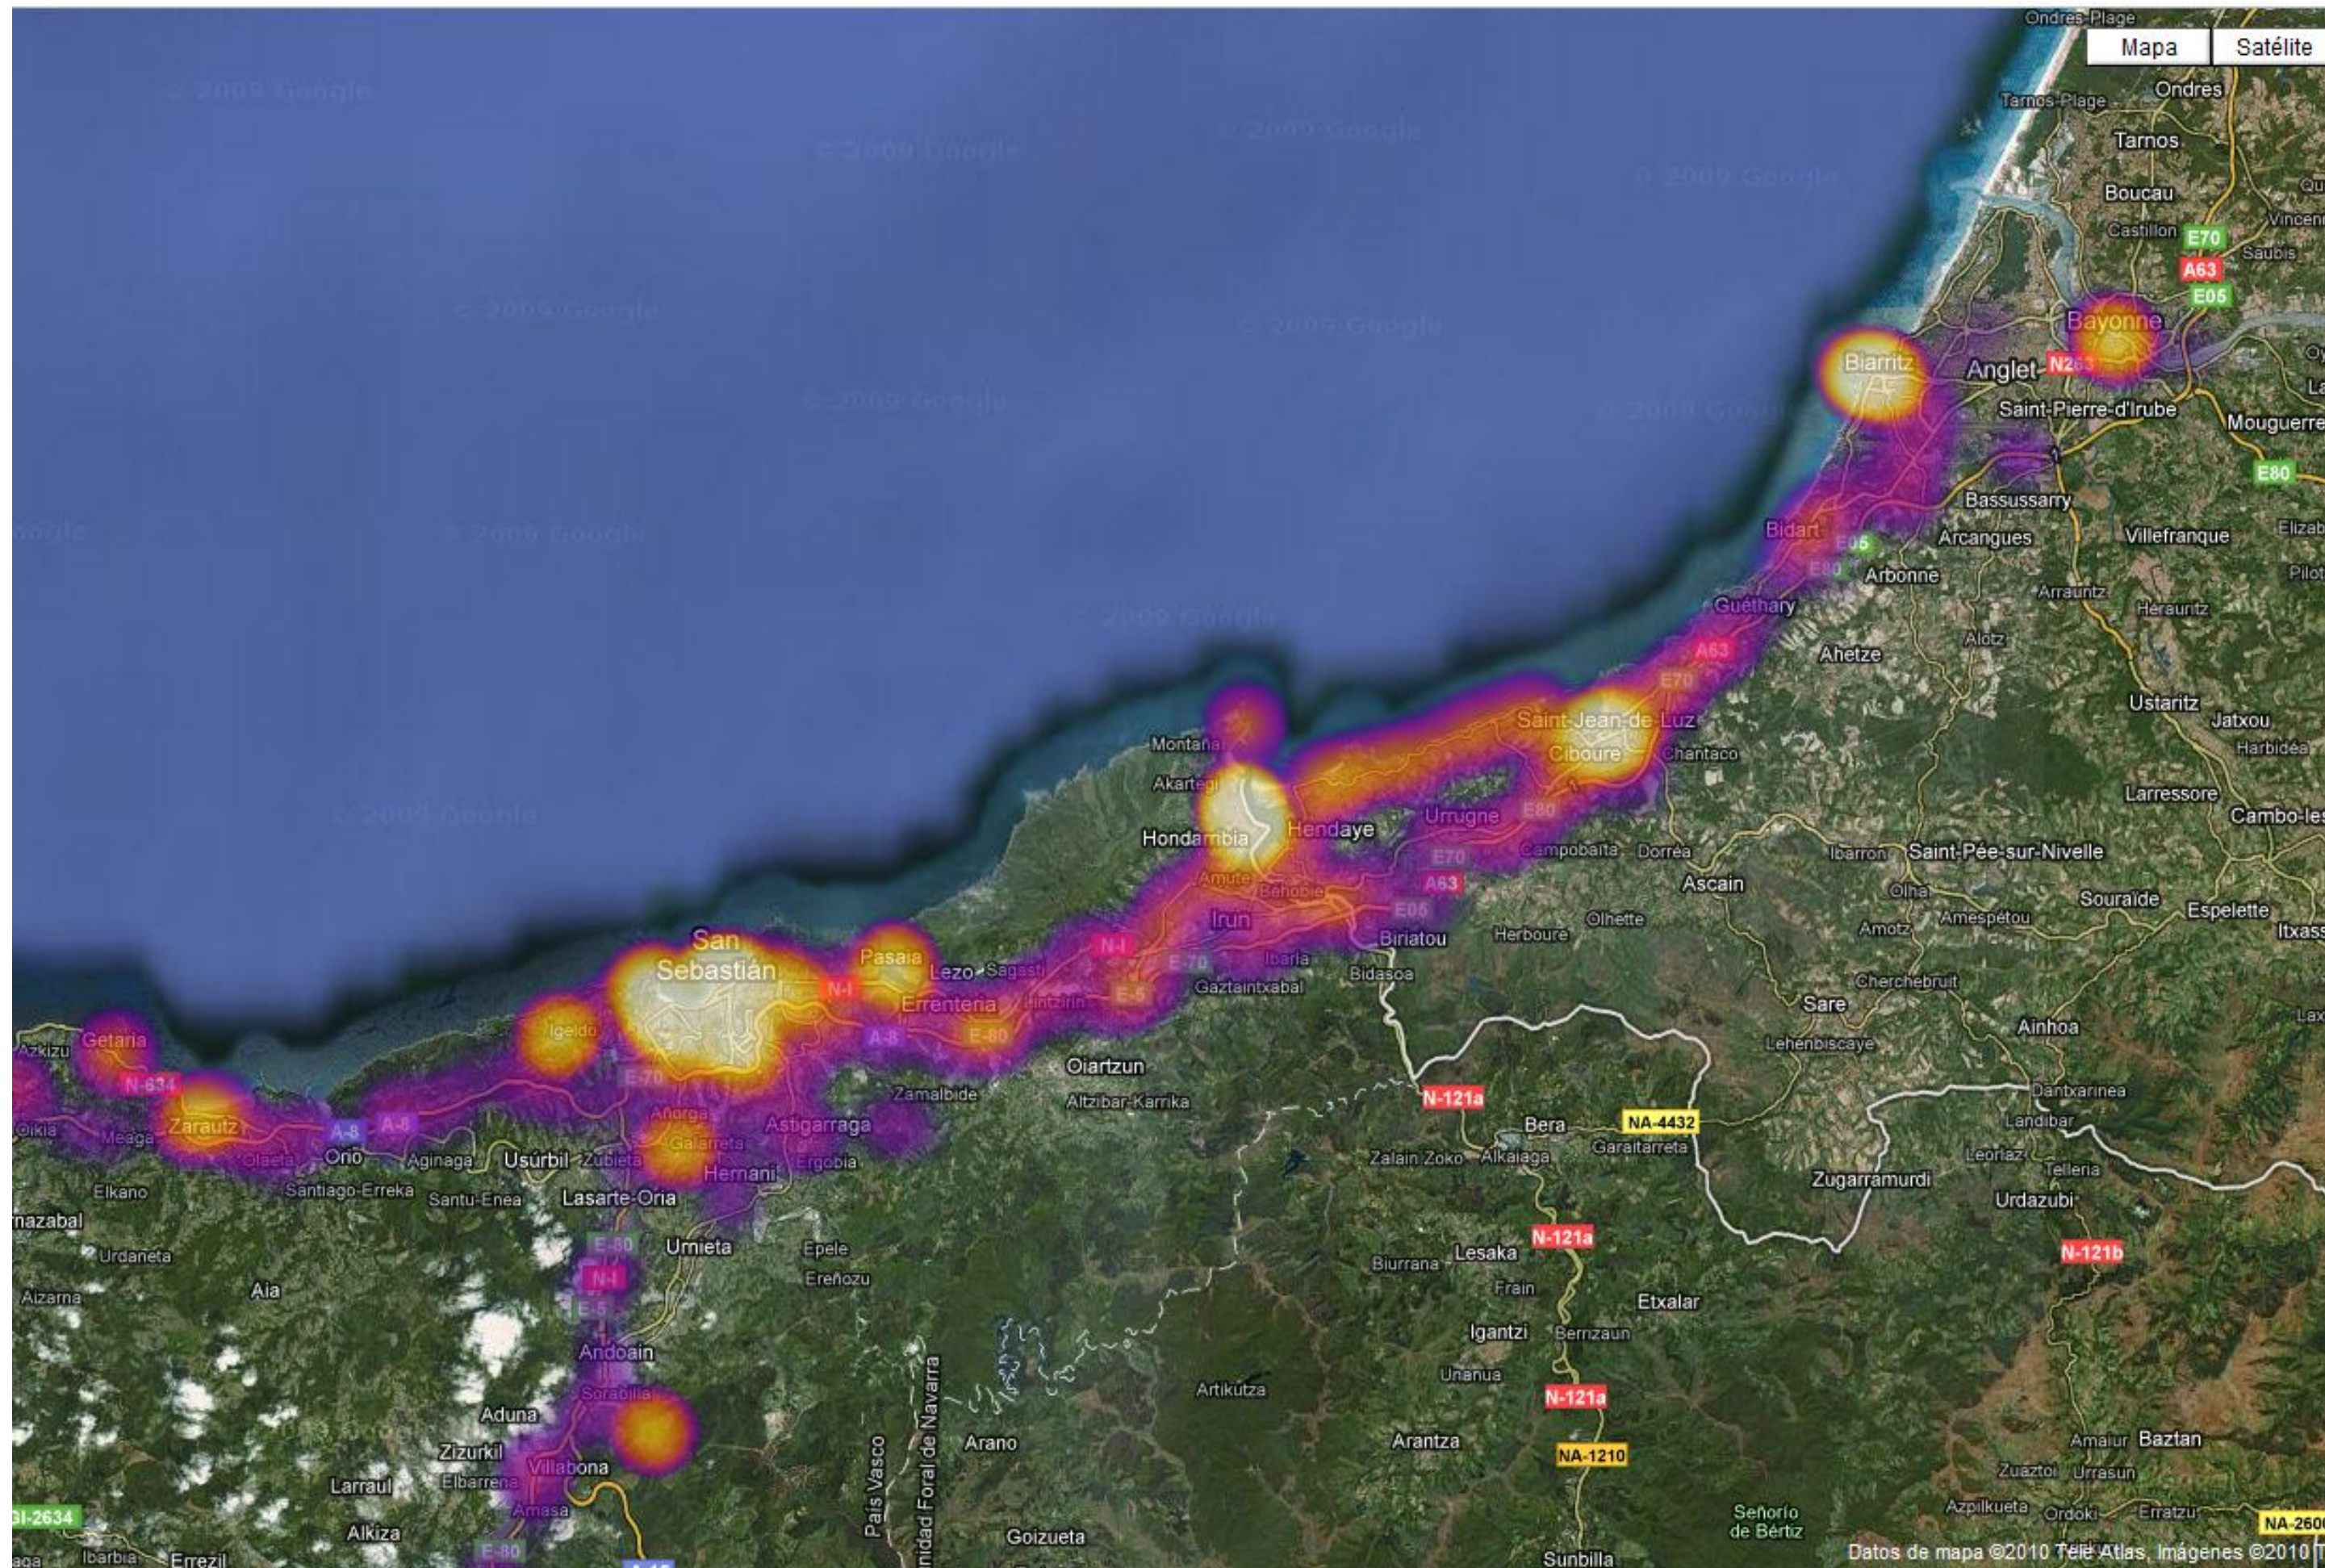

Obtain new variables

- Calculation of **times**, distances, speeds between tracking points
- Calculating new **categorical variables**: time zone, mode of transport, are outside or inside the destination

IMPLICATIONS

OPPORTUNITIES

- Improve overall quality data
- reduction of data entry error,
- reduction of recall bias (esp. for short trips or same-day visits),
- more consistency and harmonisation because of the use of algorithms
- Improved timeliness
- less collecting and processing time: near real-time results
- Reduction of burden on respondents and administrations
- It can be an additional source of information for the system of tourism statistics (quick indicators)
- Additional indicators to cover existing gaps: flows of non-residents not staying at rented accommodations (VFR, ...)

IMPLICATIONS

OPPORTUNITIES

- Information previously not available
- Movement patterns of tourists within a geographical area, detailed regional/destination level,
- Event visits (very small areas),
- Repeat visits (currently, longitudinal or panel data from surveys is very seldom available), etc.
- prediction of tourists moving from one attraction to another or the
- route they may choose to follow
- outcomes of the transition probability matrix to estimate the number of tourists
- Decide on the placement of pathways
- Estimates to make de “ecosystem or value-chain” more efficient

**MEASUREMENT
AND THEORY
IN TOURISM**

The need to understand how we have worked to convert latent constructs into meaningful measures through rigorous, objective procedures and practices.

We have to figured out how to define the kind of fundamental quantities.

MEASUREMENT AND THEORY IN TOURISM

The theory within Physical Sciences

- Strong theories
- Measurement can often be used to confirm, reject, or refine theories
- Theory is often viewed as a necessary precursor for measurement

The theory within Social Sciences

- Not clear whether it is the theory that is faulty, or the measures, or both
- Lack of strong theory in the social sciences likely plays into the lack of well-accepted common metrics

SUMMING

Measures are social constructs and the process of gaining standardization around measures is very much a social process.

Scientific approach and technology should play a central role in the development of standards

I hope I have generated some thoughts we might kick around in further discussions as we seek to understand common ways to address tourism as a discipline

**SMARTER DESTINATIONS
COLLECTIVE INTELLIGENCE**

**NEW UNDESTRANDING
NEW APPROACHES:**

**Measurement and modelling of
mobilities**

Moving forward...
